Mobile Website Provisioning

You do not have to provide this information right now, but we will need it if and when you want us to do the final integration.

Your new mobile website needs to be integrated into your existing website so that mobile users are automatically detected and redirected to it.

This involves changes in two places.

1. A small amount of code is added to the website. It detects whether a mobile-browser is calling it and if so, redirects to the mobile website. We will give you the code your web technician needs, or you can give us the web host login credentials and do it for you.

2. Ideally, a new 'A' record needs to be added in your domain registry records. Again, we will give you the settings your web technician needs, or you can give us the registrar login credentials and we'll do it for you.

If you have a very basic registry account you may not be allowed to modify the 'A' records - in which case we can either sub-optimally work around that, or you can consider adding that facility to your registry account.

☐ Option: Integrate into our website (otherwise just tell us how to do it)

Comments

We instantly encrypt your login credentials for your protection, but would prefer being given temporary user names & passwords that you change afterwards so there can be no doubt we were not involved if coincidentally at a later time your site is broken into somehow.
